## Description:

For the first time, this comprehensive tutorial brings together all the information required to design and build a successful radio controlled Hovercraft model. The book introduces the construction of Hovercraft models and the concept of their operation. Written by two leading authorities in RC Hovercraft design, Kevin Jackson and Mark Porter take you through both the theoretical and practical aspects of the design and

construction process. Covering design, construction techniques, materials, motor selection, radio systems, electrical wiring and craft operation it addresses some of the common difficulties experienced by newcomers to RC Hovercraft. The book includes a detailed step by step guide to skirt design and assembly, and the process of lift fan design and construction. Generously illustrated with photos, 3D cutaways and diagrams, the principles are explained in theory and shown at work on real models. Setup and operation of the finished model are discussed along with some of the unique challenges of controlling the craft. The book offers the experienced or first time modeler an opportunity to get started in the rapidly growing part of the RC hobby. Part plane and part boat, this unusual craft offers a whole new experience and this book is an ideal companion when venturing into this new field of radio control models.

I purchased this to prepare for a 48-hour build & race competition. Much of the book focuses on radios, servos, motors, etc. These are certainly critical for an RC hovercraft, but by no means unique - there are hundreds of books on RC airplanes that are as good or better at explaining those. This being almost the only book on RC hovercraft, the content on actual hovercraft design was lighter than I had hoped. Itd imagine this is a great book for a youngster interested in hovercraft, who has an experienced adult as a mentor - or someone familiar with RC aircraft who has lots of time to learn hovercraft by trial and error. For an engineer with no previous air cushion vehicle experience and a deadline, this wasnt any more informative than an hour on the internet - I still didnt have the decisive knowledge to build a winning craft without tons of experimentation. It was useful for its information on scale effects, though these were frequently mentioned and then glossed over. I also found it lacking on practical construction information, like materials, build techniques, etc. I ended up skimming Theory & Design of Air Cushion Craft - and found it much more useful on general theory and concepts (except that tome only considers full-size craft).
